

Accuracy Scoping Team Update and SSAD ODA

Alan Greenberg

18 May 2022

Possible Consultation with EC and DP Authorities

Proposed scenarios:

1. Analyze publicly available registration data for syntactical and operational accuracy (as was done previously in the WHOIS ARS program).
2. Analyze a sample of full registration data provided by registrars to ICANN org.
3. Proactive Contractual Compliance audit of registrar compliance with registration data validation and verification requirements.
4. Registrar registration data accuracy survey (voluntary).

Suggestions

1. Restarting the ARS with the same sampling methodology as before, but requiring Registrars to provide the full set of contact information (clearly in an automated way). ICANN would have to specify how long the information would be kept and in detail how and by whom it would be processed.
2. A complete or partial retrieval of contact info on a registrar by registrar basis (essentially an accuracy audit) with analysis similar to that used in the ARS

Draft Report

- <https://docs.google.com/document/d/13sP-2z7rusEYrDyntrgm-tclavPMJndU/edit>

Recurrent Discussions

- Definition of Accuracy
- If the current requirements (syntactic and one operational e-mail or phone number, only for new, changed or reported registrations) are sufficient
- If not, what?
- Is it reasonable, practical, viable to include identity verification?

SSAD ODA

- Currently on hold pending ICANN Org response to comments on the ODA and investigation of “Proof of Concept” (AKA the ticketing system).
