Stress Testing

Stress Testing is defined as:
•	Test_the process, criteria and methods as developed by applying the process to "corner case" situations or scenario's and understand whether such a case results in an unwanted outcome or side effects.
•	If the outcome of that situation results in an unwanted outcome or side effects adjust Policy/Process as needed.

After completion of the draft process the Stress Testing was conducted through answering the following questions:
- What is the outcome of this situation when the process is invoked?
- Is the outcome of that situation/the result unwanted or are side effect unwanted / unacceptable?
- Does the Policy/Process need to be adjusted/refined?

ccPDP4 workshop will be used to identify the various situations
