# Questions for the Panel

After panelists describe current approaches to increasing broadband access, we will discuss the following questions:.

1) Is the current approach effective?
2) How do you define effectiveness for such a program?
3) How do we move beyond mere endpoint availability to other issues such affordability, literacy, device availability, enduser safety/security, etc.
4) Are these being adequately addressed now?
5) What are the challenges of different geographies (urban, suburban, rural, indigenous)
6) Have today's polarized politics (particularly in the US but by no means limited to the US) interfered with these projects?
7) What should end users be doing to get more help and to advance these goals more generally?
