

Name

Benno Overeinder

Affiliation and Current Position

NLnet Labs, managing director

Relevant Qualifications

I am active in the IETF, DNS OARC and RIPE and other NOG communities, discussing the stability and security of internet infrastructure (DNS and routing in particular). Working for NLnet Labs, an open-source DNS software vendor, I am very much engaged in DNS standards, security and operational practices. I am involved in applied research projects on DNS and internet routing, stability and security (these projects are run either with colleagues at NLnet Labs or with external partners like universities or research institutes). One specific project I am involved with is the SAND project that focuses on monitoring and managing anycast networks for DNS services.

Motivation

I have an interest in the deployment and operation of the root server system. From my activities as software developer and researcher, I think I can share my experiences and contribute to discussions.

Indication of Availability

I can contribute about 2 days a month to RSSAC-related activities. For RSSAC meetings collocated with other community meetings: IETF, RIPE, (most) DNS OARC, ICANN at least one per year.
