

Rolling the Root Zone DNSSEC Key Signing Key

Dr. Richard Lamb | November 2016 richard.lamb@icann.org

Motivation for this talk

- ICANN is about to change an important configuration parameter in DNSSEC
- For a network operator, this may create a need for action
- This discussion is meant to inform: Why this is happening, what is happening, and when
 - Highlighting: the availability of project plan documents

Do Class Exercise Here

Current Root KSK

- The current root KSK was created in 2010
 - Stored in Hardware Security Modules in two Key Management Facilities
 - The operations surrounding the key is an entirely different talk (21 trusted community representatives, multi-person controls, key ceremonies, 3rd party audit.)

Why change the current Root KSK?

- Good cryptographic hygiene
 - Secrets don't remain secret forever
- Good operational hygiene
 - Have a plan, complete enough to execute
 - Exercise the plan under normal circumstances
- Promised to do so in a policy statement* in 2010
 - “Each RZ KSK will be scheduled to be rolled over through a key ceremony as required, or after 5 years of operation.”

* <https://www.iana.org/dnssec/icann-dps.txt> Section 6.5

Bottom Line

- Changing the root KSK will impact just about all DNSSEC validations (15% worldwide)
 - If the trust anchor is "misconfigured" (i.e., the wrong key) DNSSEC will reject legitimate responses
 - To anyone or any process relying on DNS, it will appear that the desired data is unavailable, website is unreachable, "the Internet is down"

- The KSK Rollover Plan Documents

- Available at: *<https://www.icann.org/kskroll>*
 - 2017 KSK Rollover Operational Implementation Plan
 - 2017 KSK Rollover Systems Test Plan
 - 2017 KSK Rollover Monitoring Plan
 - 2017 KSK Rollover External Test Plan
 - 2017 KSK Rollover Back Out Plan
- We encourage interested folks to given them a read

Overview of Project Plans

- The new KSK was created on October 27, 2016
- Expect new KSK to be install on backup site Feb 2017

```

Handwritten signatures and initials are present over the terminal output, including names like "Alain ANSA" and "R. C. C."

Upcoming Dates to Watch

- September 19, 2017
 - The root zone DNSKEY set will increase to 1414 bytes for 20 days, prior to that date 1139 bytes has been the high water mark
- **October 11, 2017**
 - On this date the root zone DNSKEY set will be signed only by the new KSK
- January 11, 2018
 - The root zone DNSKEY set will increase to 1425 bytes for 20 days

Operational Implementation Plan Timeline

Trust Anchor Management

- How do you trust and configure?
 - Are trust anchors subject to configuration control?
 - Rely on embedded data in software?
 - Are DNSSEC validation failures monitored?
- Automated Updates of DNSSEC Trust Anchors
 - Most direct, reliable means for getting the key
- Negative Trust Anchor management – RFC 7646
 - Protects against errors made by others

Tools & Testbeds

- We are working with DNS software and tool developers and distributors
 - Management/troubleshooting aids
 - Updates of bundled keys
- Testbeds for Code Developers
 - Automated updates: *<http://keyroll.systems/>*
 - Root zone model: *<https://www.toot-servers.net/>*
- Testbeds for Service Operators
 - I.e., using "off-the-shelf" parameters
 - Planned for end-of-2016
