

Sub Proc Comment

Presentation by Jonathan Zuck

Submitted Comments

- **Community Applications**
- **Different TLDs**
- **Universal Acceptance**
- **PICs**
- **Metrics**

Substance of Comment for Community Application

- Recommends that the guidelines have a definition of “community”
- Recommends three categories for applicants of Community Apps:
 - (1) existing registry operator,
 - 2) A new registry operator that applies on behalf of the community and might be specialized into community-based strings, and
 - 3) new registry start up.
- Discusses Community-Based Strings and Fixes to application process
- Calls for clear selection criteria for reviewers

Different TLD Types

- Supports Community Prioritization Applications
- Guidelines should define “community”
 - It should not impose narrowly defined restrictions so as to limit applicants who would otherwise fall into the “community” category.
- Should this definition of “community” be the same as “community applications” (discussion from last call)?

Universal Acceptance

- Require registries to be Universal Acceptance (UA) ready as part of their application.
- Systems should be:
 - ready for IDN registrations,
 - ready to take all domains as nameservers and child host and
 - able to manage any email address internationalization (i.e. <nativelanguage>@<idn>.<idn>)
- Registries should be required to ensure that their suppliers as well as their registrars are also UA ready.

PICs

- **ALAC** supports the prospects of ICANN codifying mandatory PICs.
- The **ALAC** supports the report's recommendation to continue voluntary PICs provided they are enforceable.

Metrics

- ICANN needs to better define its metrics that it will use to determine “success” of a program.
- The ICANN community should leverage existing metrics it has already developed and collected (e.g., the market place health index and market indicators) to make such determinations.
- Metrics should not solely rely on ex post data points, but should be apart of the process at the outset.
